

Scr. No10/725,154

PATENT
02P19675US01**Amended claims**

1. (Original) A document generation system for producing a document from information derived from an information repository, comprising:

a source of code representing a document template including, data fields containing placeholder items to be replaced by desired data items, and also including a repetition identifier indicating one of said data fields is to be replicated to provide a group of data fields to be replaced by a plurality of said desired data items;

a source of document generation control information supporting insertion of said desired data items derived from said information repository in said data fields; and

a document processor for applying said control information in replacing template document data field placeholder items with desired data items, to produce a generated document.

2. (Original) The system according to claim 1, wherein

said control information contains at least one of, (a) an identification of data fields in said template document available to be replaced by desired data items, (b) an identification of a location in said information repository of a desired data item associated with an individual data field, and (c) an identification of a location in said information repository of a first data item for insertion in said individual data field of said group of data fields and data items sequentially linked to said first data item are inserted in remaining data fields of said group of data fields.

3. (Original) The system according to claim 2, wherein

said location identifier of said first data item comprises an Extensible Markup Language compatible XPath value.

4. (Currently amended) The system according to claim 1, ~~wherein~~ including

~~said a~~ a data source file associating data field names of said document template with a data location in an information repository, said data source file comprising ~~comprises~~ at least one of, (a) a comma delimited file and (b) a flat file.

Ser. No10/725,154

PATENT
02P19675US01

5. (Original) The system according to claim 1, wherein said repetition identifier comprises a Rich Text Format (RTF) compatible Bookmark.

6. (Currently Amended) The system according to claim 1, wherein said code representing a said document template is at least one of, (a) word processing application compatible and (b) Rich Text Format (RTF) compatible.

7. (Original) The system according to claim 1, wherein said document processor processes template document data, excluding said desired data items inserted in said placeholder items, by incorporating said template document data in said generated document and said generated document is compatible with Extensible Stylesheet Language (XSL).

8. (Original) The system according to claim 1, wherein said generated document comprises one or more of, (a) an SGML document, (b) an XML document, (c) an HTML document, and (d) a multimedia file.

9. (Original) The system according to claim 1, wherein said desired data items derived from said information repository are Extensible Markup Language (XML) compatible data items derived from an XML compatible document.

10. (Original) The system according to claim 1, wherein said document processor processes template document data in Rich Text Format (RTF) together with desired data items derived from said information repository in Extensible Markup Language (XML) to provide said generated document in an Extensible Stylesheet Language (XSL) format.

11. (Original) The system according to claim 10, wherein said document processor includes an XML parser to process said generated document in Extensible Stylesheet Language (XSL) format to provide a processed document in Rich Text Format (RTF).

Ser. No10/725,154

PATENT
02P19675US01

12. (Original) The system according to claim 1, wherein
said document processor examines said document template to identify an individual data field containing a placeholder item and incorporate a link in said individual data field identifying a corresponding item in said document generation control information, said corresponding item enabling locating one of said desired data items in said information repository for insertion in said individual data field.

13. (Currently Amended) A graphical User interface system supporting adaptive generation of a document, comprising:

an image generator for generating at least one image window including:

an image element enabling User selection of a text processing application compatible document template, said document template including, data fields containing placeholder items to be replaced by desired data items, and also including a repetition identifier indicating one of said data fields is to be replicated to provide a group of data fields to be replaced by a plurality of said desired data items; and

an image element for initiating examination of said document template to identify an individual data field and insert a desired data item derived from an information repository in said data field, to produce a generated document.

14. (Currently Amended) A method for adaptively producing a document from information derived from an information repository, comprising the steps of:

examining text processing application compatible code representing a document template, said document template including, data fields containing placeholder items to be replaced by desired data items, and also including a repetition identifier indicating one of said data fields is to be replicated to provide a group of data fields to be replaced by a plurality of said desired data items; and

applying control information supporting insertion of said desired data items derived from said information repository in said data fields to replace template document data field placeholder items with desired data items, to produce a generated document.

PATENT
02P19675US01

15. (Currently Amended) A method for adaptively producing a document comprising the steps of:
receiving ~~an~~ text processing application compatible electronic document template including:
data fields having placeholder items, and
at least one repetition identifier indicating at least one of said data fields that is to be replicated;
receiving data items; and
merging said electronic document template with said data items to produce the document responsive to replacing placeholder items with said data items, and responsive to replicating the at least one of said data fields that is to be replicated to provide a group of data fields to be replaced by a plurality of said desired data items.
16. (Original) A method for producing a document according to claim 15, wherein said step of merging is performed by at least one of, (a) XSL compatible code and (b) a mail merge application program.
17. (Currently Amended) A method for producing a document according to claim 15, further comprising the steps of:
receiving a selection of ~~the~~ text processing application compatible electronic document templates; and
receiving a selection of a source of the data items.
